

1. Procurement Module

Procurement Initiation

The procurement process can be initiated through three different sources:

1. Order Management

A new order can be received or created in the Order Management module through any of the following four channels:

- Website synchronization
- WhatsApp Business integration
- Email parsing
- Manual order creation within the OS

Once an order is received, the system checks whether the required finished goods are available in stock.

Two scenarios may arise:

1. **Stock is available:** The order proceeds through the standard fulfilment and dispatch flow.
2. **Stock is unavailable or insufficient:** The requirement is routed either to:
 - Production, if the item must be manufactured; or
 - Procurement, if the item or required material must be purchased.

If the requirement is routed to Procurement, the relevant requirement and quantity must automatically appear in the Procurement module.

2. Live Inventory

The Live Inventory screen maintains a predefined minimum stock level for each item.

For example, if the minimum required stock level for an HIV Rapid Test is 100,000 units and the available stock falls to 80,000 units, the system must automatically generate a low-stock alert.

The Live Inventory screen contains the following three summary tiles:

- Total Products Available
- Low-Stock Alerts
- Out-of-Stock Items

When the user opens the **Low-Stock Alerts** tile, the system displays:

- The affected item
- The current available quantity
- The predefined minimum stock level
- The quantity required to restore the minimum stock level

The user can then send the required quantity to the Procurement module.

If an item remains under the low-stock category for the configured period of 30 or 60 days, it must subsequently be reflected under the **Out-of-Stock Items** tile.

3. Low-Stock Purchase Request Form

The Stores module contains a **Low-Stock Purchase Request Form**.

A store user can submit this form when:

- An existing inventory item is running low; or
- An item that is not maintained or configured in Live Inventory needs to be purchased for the office or another internal requirement.

The user enters the required item and purchase details in the form. Once submitted, the requirement must automatically update the alert box on the Procurement screen for further processing.

Purchase Order, Goods Receipt and Quality Control Flow

1. Purchase Order Generation

Once the procurement requirement has been processed, a **Purchase Order (PO)** is generated.

Immediately after the PO is created, the **Inbound Materials** alert box under the **Stores and SCM module** is automatically updated.

2. Inbound Materials Alert

The Inbound Materials alert informs the responsible Stores or SCM user that:

- The listed materials have been ordered.
- The materials are currently incoming.
- The delivery is expected at the manufacturing facility.

The responsible user opens the relevant inbound-material entry when the materials arrive at the facility.

3. Goods Receipt Entry

The Goods Receipt form is automatically pre-filled using the corresponding PO details.

The form displays the **ordered quantity** for every item. The Stores user is only required to enter the **actual quantity received** against it.

Once the actual received quantities are entered and the Goods Receipt form is submitted, the system updates the following modules:

- Quality
- Billing

4. Quality Control Initiation

Submission of the Goods Receipt form initiates the quality-control process for the received raw materials and packing materials.

The quality process follows this sequence:

1. COA Number Generation
2. Sample Advice Generation
3. RM/PM COA Generation

5. COA Number Generation

The first step is the generation of a **Certificate of Analysis (COA) number** for the received material.

Each raw material and packing material has a predefined testing template configured within the RMBM system. After the COA number is generated, the relevant product-specific template becomes available to the Quality Executive or Quality Officer.

The responsible quality user completes the required test details in the relevant form.

6. Sample Advice Generation

After the initial quality form is completed, the entry moves to **Sample Advice Generation**.

The Sample Advice is generated for the received material and records the material submitted for quality testing.

7. RM/PM COA Generation

Once the Sample Advice process is completed, the entry moves to **RM/PM COA Generation**.

At this stage, the final **Certificate of Analysis for the Raw Material / Packing Material** is generated, completing the defined quality process for the incoming material.

8. Billing Module Update

After the material is physically received at the facility and the Goods Receipt form is submitted, the corresponding entry also appears under **Incoming Bills** in the Billing module.

The subsequent Incoming Bills process will continue from this point.
